1.3k v0.13.2.2 On a completely different note, I am considering creating an application (in Haskell) to generate the resulting rules for you. A separate post might discuss that, as I don't know how much of this I can accomplish, yet. Cheers! A: I'm not sure if I understood the question properly, but maybe this helps: The solution is not to let the workers run in the danger zone. That can lead to very real problems because there is no supervisor telling them "You're off your job." Each drone must have a supervisor. We'll code it as a generic supervisor. We'll model it as a Supervisor T and provide a function clone :: Supervisor -> Supervisor -> Superinted T. This supervisor is also not a solution. It needs a worker. We'll provide a function rify :: Worker -> Supervisor -> T. We'll also need a function of type Superinted T -> Superinted T. If I'm understanding the question correctly, then this is about what you want to do, isn't it? Q: Why do I get a "Missing bibliography section" error with the biblatex package? I'm trying to use biblatex but I get an error: "Missing bibliography section". Here's the minimal code: `\documentclass{article}`
`\usepackage[style=authoryear]{biblatex}` `\addbibresource{test.bib}` `\begin{document}` `ocite{*}` `\printbibliography` `\end{document}` test.bib has a single entry @inproceedings(sunny, title = {Funny things happen}, year = {2016}, author = {Sunny}, booktitle = {Funny things}, url = { }) If I load biblatex alone, it runs without problem. What should I do to get rid of this error? With biblatex-contrib the error is: La 82157476af
